If required, I would be happy to provide an even more detailed set of data, figures, and a more detailed analysis of these figures and data, but in my expert opinion, it does not seem necessary given that, even to the non-expert eye, these illustrations clearly indicate that the frequency content of the two works at issue, on a 1-bar level, and on an individual beat by beat level are distinct. Waveform views can look deceptively similar (although it is shown above that these too have clearly original characteristics), however, as all of these comparison figures show, an FFT-Analysis (in which the algorithm has the same exact analysis settings) reveals what is truly and completely unique about an audio signal – the unique DNA of the sound, the sonic fingerprint. All of these figures above clearly show that the audio source materials used in *Aparthenonia* is unique and original, and is not at all based on or copied or derived from *Funky Drummer II*.

**Richard Boulanger, Ph.D.**
